

Bug Report

AutomationExercise.com

Manual Exploratory Testing

PREPARED BY	DATE	VERSION
Muhammad Huzaifa	01 August 2026	1.0

Senior SQA Engineer |

Defects found: 11 (4 High, 4 Medium, 3 Low)

Evidence: annotated screenshots and Loom screen recordings

Sample report prepared for portfolio purposes. Client project reports follow the same structure, with severity SLAs and sprint-level tracking.

1. Executive Summary

This report covers a manual exploratory testing session on AutomationExercise.com, a public e-commerce practice site. Testing focused on the shopping cart, checkout entry, login, signup, account management and general UI. 11 defects were found and documented: 4 High, 4 Medium and 3 Low.

The biggest problem area is the cart quantity field. It accepts negative values (BUG-001), zero (BUG-002) and extremely large values (BUG-005), and in all three cases the user can still proceed to checkout. There is no validation on this field on either the client or the server. In a live store, the negative-quantity case could be abused to lower the payable amount of an order. One shared fix (validate $1 \leq \text{quantity} \leq \text{available stock}$, on both sides) covers all three defects.

Two more High severity issues were found. The Delete Account link in the main navigation deletes the account immediately, with no confirmation step, on a single click (BUG-004). And the signup email uniqueness check is case-sensitive, so the same mailbox can register multiple accounts just by changing letter casing (BUG-003).

On the Medium side: product search shows a completely blank area with no message when a query matches nothing (BUG-006), and both the Contact Us form and the Signup form accept malformed, undeliverable email addresses like test@c (BUG-007, BUG-008). The last two together show that email format validation beyond the browser default is missing across the application.

The Low severity findings are an outdated 2021 copyright year in the footer (BUG-009), a login form that re-submits data and re-shows the old error on refresh because the page does not use the Post/Redirect/Get pattern (BUG-010), and one carousel card that shows the price where the product name should be (BUG-011).

Each defect below has full reproduction steps, expected vs actual results, impact, and an evidence reference. Loom recording links are in the defect entries and listed again in Appendix B.

2. Scope & Environment

Application Under Test	https://automationexercise.com/
Application Type	Public e-commerce practice/demo web application
Modules Covered	Home/Footer, Recommended Items carousel, Product Search, Product Detail, Shopping Cart, Checkout entry, Login, Signup/Registration, Account Management, Contact Us
Testing Type	Manual exploratory (functional, validation, UI)
Browser	Google Chrome (latest stable, 64-bit)
Operating System	Windows 11 (64-bit)
Screen Resolution	1920 x 1080
Test Data	Dummy/test accounts and sample products only
Test Date	July 2026
Evidence	Annotated screenshots (embedded) and Loom screen recordings (linked)

3. Severity & Priority Definitions

3.1 Severity

Severity	Definition
Critical	System crash, data loss, security breach, or complete blockage of a core business flow with

	no workaround.
High	Major functional failure or missing validation on a core flow (e.g. orders, payments) that produces incorrect business results. A workaround may exist but is not acceptable.
Medium	Functional defect on a secondary flow, or incorrect behavior with a reasonable workaround. Noticeable impact on user experience or data quality.
Low	Cosmetic or minor usability issue. No impact on core functionality or data integrity.

3.2 Priority

Priority	Definition
P1 - Urgent	Fix immediately. Blocks release or exposes the business to direct loss.
P2 - High	Fix in the current release cycle.
P3 - Medium	Fix in a near-term release, scheduled alongside related work.
P4 - Low	Fix when convenient, batched with other minor changes.

4. Defect Summary

Defects are listed by priority, highest first. Related defects are cross-referenced in their detailed entries.

ID	Title	Module	Severity
BUG-001	Cart accepts negative quantity and shows a negative order total, checkout still available	Shopping Cart	High
BUG-002	Cart accepts zero quantity, user can proceed to checkout with a Rs. 0 order total	Shopping Cart	High
BUG-003	Email uniqueness check is case-sensitive, same mailbox can register duplicate accounts	Signup	High
BUG-004	Delete Account runs immediately with no confirmation step	Account Management	High
BUG-005	Cart accepts an extremely large quantity (9,999,999,999,999) with no upper limit or stock check, checkout still available	Shopping Cart	Medium
BUG-006	Product search shows no message when a query matches nothing	Product Search (All Products page)	Medium
BUG-007	Contact Us form submits with all fields empty and a malformed email address	Contact Us form	Medium
BUG-008	Signup accepts a malformed, undeliverable email (invalid_email@k) and creates the account	Signup	Medium
BUG-009	Footer shows outdated copyright year (2021)	Footer	Low
BUG-010	Login page does not use Post/Redirect/Get, refresh re-submits form data and the validation error	Login	Low
BUG-011	Recommended Items carousel shows the price in place of the product name for one product	Home Page	Low

5. Detailed Defect Reports

BUG-001 | Cart accepts negative quantity and shows a negative order total, checkout still available

Module	Shopping Cart / Order Calculation
Severity	High
Priority	P1 - Urgent
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	At least one product available in the catalog. No login required.
Steps to Reproduce	1. Go to https://automationexercise.com/ and open any product detail page (used a product priced Rs. 1,000). 2. In the Quantity field, enter -13. 3. Click "Add to cart", then open the Cart page via "View Cart". 4. Check the Quantity and Total columns for the added line item. 5. Check whether the "Proceed To Checkout" button is still available.
Expected Result	Quantities below 1 should be rejected on both client and server side with a validation message. A negative line total should never be calculated, and checkout should not be reachable with an invalid cart.
Actual Result	The quantity -13 is accepted with no validation error. The cart shows the line total as "Rs. -13000" and "Proceed To Checkout" still works, so the user can continue the purchase flow with a negative order value.
Impact	In a real store, negative totals can corrupt order records and break invoicing and inventory logic. It could also be abused to reduce the payable amount of an order by adding a negative-quantity line to offset other items. Since the invalid value survives into the cart calculation, this is a server-side validation gap, not just a UI issue.
Evidence	Screenshot: BUG-001_negative_quantity_cart.png Loom recording: captured; shared after contract start

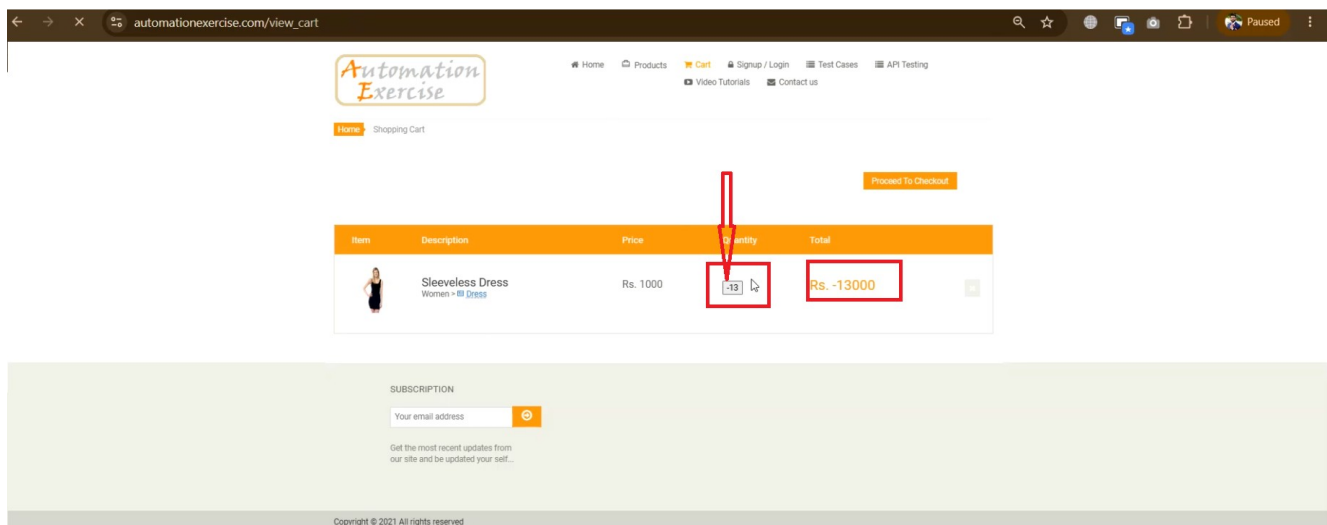

Figure 1: Cart line with quantity -13, total Rs. -13000, checkout button still active.

BUG-002 | Cart accepts zero quantity, user can proceed to checkout with a Rs. 0 order total

Module	Shopping Cart / Checkout
Severity	High
Priority	P2 - High
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	At least one product available in the catalog. No login required to reach the cart.
Steps to Reproduce	1. Go to https://automationexercise.com/ and open any product detail page. 2. In the Quantity field, enter 0. 3. Click "Add to cart", then open the Cart page via "View Cart". 4. Check the Quantity and Total columns for the added line item. 5. Click "Proceed To Checkout" and confirm the checkout flow continues with a zero-value order.
Expected Result	Quantities below 1 should be rejected on both client and server side with a validation message. A cart line with zero quantity should never be created, and checkout should not be reachable with a zero-value cart.
Actual Result	The quantity 0 is accepted with no validation error. The cart shows a line item with quantity 0 and total Rs. 0, and "Proceed To Checkout" still works.
Impact	Zero-value orders create junk order records and can break fulfillment, invoicing and reporting logic that assumes at least one unit per line. Together with BUG-001 this shows the quantity field has no lower bound at all. One shared fix (quantity ≥ 1 , validated on client and server) covers both defects.
Related Defects	BUG-001, same root cause. BUG-001 is the financially abusable variant (negative values), this one is the data-integrity variant (zero values).
Evidence	Screenshot: BUG-002_zero_quantity_checkout.png Loom recording: captured; shared after contract start

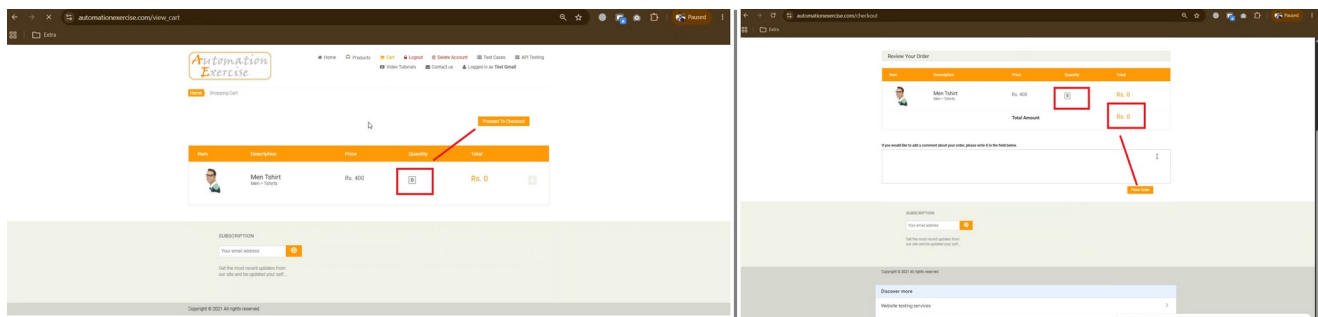

Figure 2: Left, cart line with quantity 0 and Rs. 0 total. Right, checkout "Review Your Order" page reached with a Rs. 0 total amount.

BUG-003 | Email uniqueness check is case-sensitive, same mailbox can register duplicate accounts

Module	Signup / Registration
Severity	High
Priority	P2 - High
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080

Preconditions	A disposable test email address available for registration.
Steps to Reproduce	1. Go to https://automationexercise.com/login and complete signup with an email in lowercase . Finish registration and log out. 2. Return to the signup form and register again with the same email in different casing . 3. Check the outcome of the second registration attempt.
Expected Result	The uniqueness check should normalize email casing before comparing (in practice all major providers treat addresses case-insensitively), so the second attempt should be rejected with the existing "Email Address already exist!" message.
Actual Result	The second registration succeeds and a separate account is created. Two accounts now exist for what is effectively the same mailbox, differing only in letter casing.
Impact	The same real inbox can control multiple accounts. This creates login and password-reset confusion (which account does a case-variant login resolve to?), inflates user counts, and can be abused for promo or referral farming and rate-limit evasion.
Root Cause Notes	The check appears to compare the submitted email against stored values with a case-sensitive string comparison instead of lowercasing both sides first. The standard fix is to store and compare a lowercased copy of the email.
Evidence	Loom recording: captured; shared after contract start

BUG-004 | Delete Account runs immediately with no confirmation step

Module	Account Management / Primary Navigation
Severity	High
Priority	P2 - High
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	User is logged in with a registered account.
Steps to Reproduce	1. Log in to https://automationexercise.com/ with a registered account. 2. In the top navigation bar, click "Delete Account" (it sits right next to "Logout"). 3. Check the result.
Expected Result	An irreversible destructive action should require an explicit confirmation before it runs. At minimum a confirmation dialog; for account deletion usually password re-entry or a type-to-confirm step with a clear warning.
Actual Result	The account is deleted immediately on a single click. No confirmation dialog, warning or password check appears, and there is no undo or grace period.
Impact	One click permanently destroys the account and all its data with no way back. The risk is made worse by placement: "Delete Account" sits directly beside "Logout", the most frequently clicked account action, so an accidental misclick is a realistic everyday case. Confirmation on destructive actions is a basic safeguard in production systems.
Evidence	Loom recording: captured; shared after contract start

BUG-005 | Cart accepts an extremely large quantity (9,999,999,999,999) with no upper limit or stock check, checkout still available

Module	Shopping Cart / Checkout
Severity	Medium
Priority	P3 - Medium
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	At least one product available in the catalog. No login required to reach the cart.
Steps to Reproduce	- Go to https://automationexercise.com/ and open any product detail page (used a product priced Rs. 1,000). - In the Quantity field, enter 9999999999999 (13 digits). - Click "Add to cart", then open the Cart page via "View Cart". - Check the Quantity and Total columns for the added line item. - Click "Proceed To Checkout" and confirm the checkout flow continues.
Expected Result	The application should enforce a sensible maximum order quantity and check the requested amount against available stock, rejecting values over either limit with a clear message. Checkout should not be reachable with an order that can never be fulfilled.
Actual Result	The 13-digit quantity is accepted with no validation error or stock check. The cart shows a line total of Rs. 9,999,999,999,999,000 (Rs. 1,000 x 9,999,999,999,999) and "Proceed To Checkout" still works.
Impact	Orders like this can never be fulfilled and pollute order data. Totals at this scale also go past JavaScript's MAX_SAFE_INTEGER (about 9.007 quadrillion), so client-side math can silently return wrong results, and smaller integer types in downstream systems (invoicing, reporting, ERP) can overflow. Together with BUG-001 and BUG-002 this confirms the quantity field has no validation limits at all. One shared fix (1 <= quantity <= available stock, on client and server) covers all three defects.
Related Defects	BUG-001 (negative quantity) and BUG-002 (zero quantity). This is the upper-bound variant of the same missing validation.
Evidence	Screenshot: BUG-005_extreme_quantity_cart.png Loom recording: captured; shared after contract start

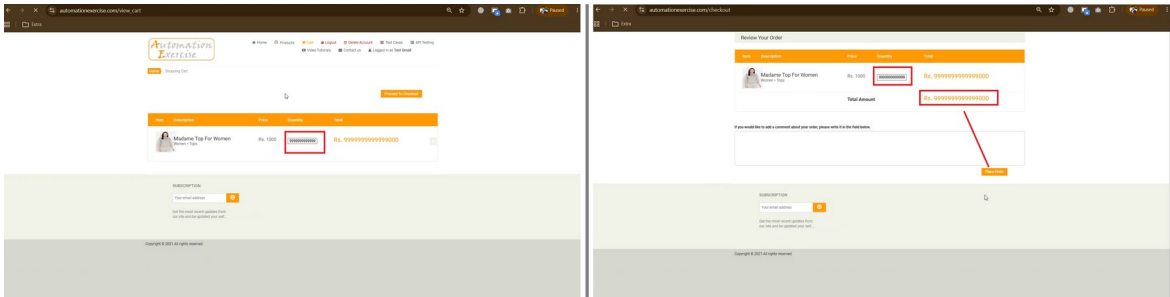

Figure 3: Left, cart accepts the 13-digit quantity with total Rs. 9,999,999,999,999,000. Right, checkout page reached with the same total.

BUG-006 | Product search shows no message when a query matches nothing

Module	Product Search (All Products page)
--------	------------------------------------

Severity	Medium
Priority	P3 - Medium
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	None. The search box is on the All Products page, no login required.
Steps to Reproduce	1. Go to https://automationexercise.com/products. 2. In the search box, enter a query that matches no products (used "jec"). 3. Click the search icon and check the "Searched Products" section (URL: /products?search=jec).
Expected Result	When a search returns zero matches, the results area should show a clear message like "No products found matching your search", ideally with a link back to all products.
Actual Result	The "Searched Products" heading renders above a completely blank area. There is no message or indicator of any kind, so the user cannot tell the difference between zero matches, a failed request, or a page still loading.
Impact	In a real store this is a dead end in the main product discovery flow. A user who mistypes a query gets nothing back and may think the site is broken, which directly hurts conversion. The missing empty-state element also makes test automation harder because there is nothing stable to assert on for the no-results case.
Evidence	Screenshot: BUG-006_search_no_results_feedback.png

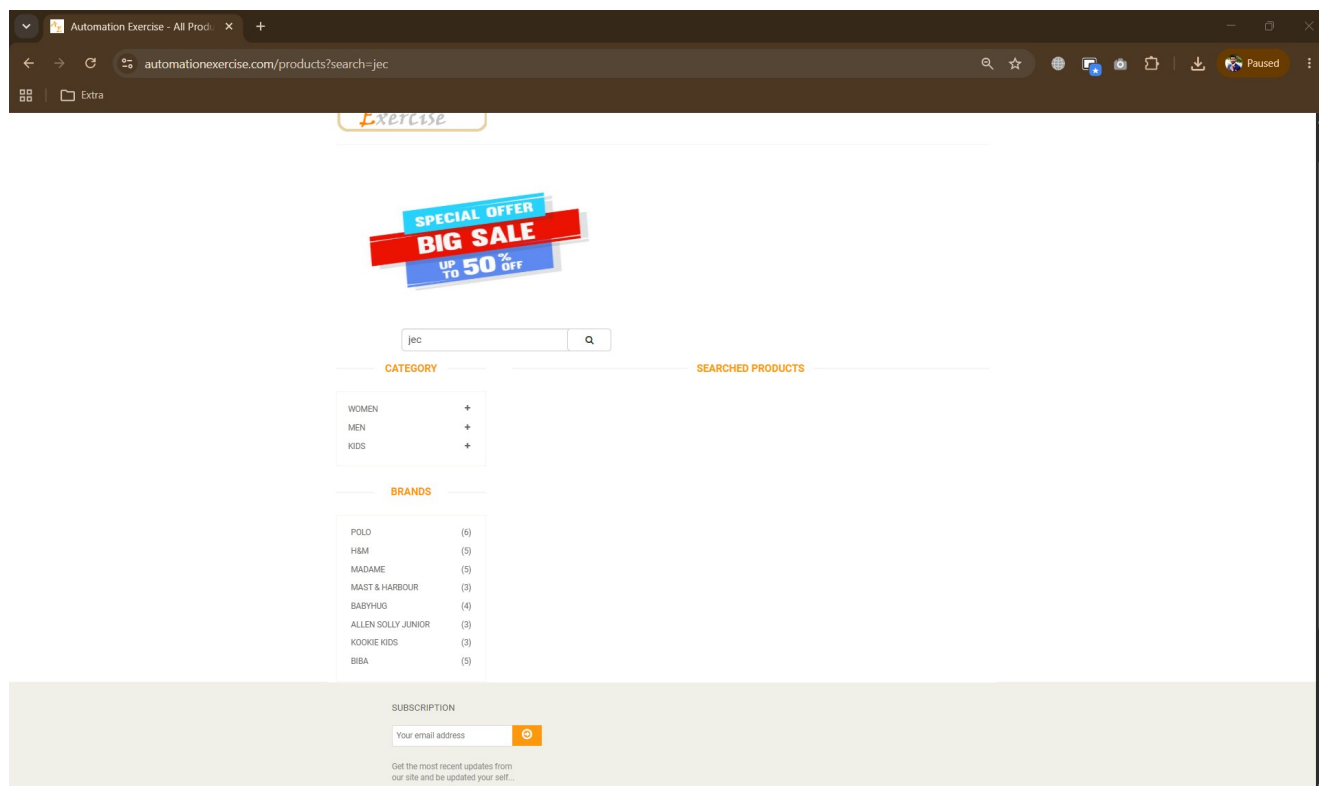

Figure 4: "Searched Products" heading with a blank results area for the query "jec".

BUG-007 | Contact Us form submits with all fields empty and a malformed email address

Module	Contact Us form
--------	-----------------

Severity	Medium
Priority	P3 - Medium
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	None. The Contact Us form is publicly accessible.
Steps to Reproduce	1. Go to https://automationexercise.com/contact_us. 2. Leave Name, Subject and Message empty. Do not attach a file. 3. In the Email field, enter "test@c" (no top-level domain). 4. Click Submit and check the outcome.
Expected Result	The form should reject the submission. Name, Subject and Message should be required fields, and the email should be validated as a deliverable address (top-level domain required), with clear messages for each problem.
Actual Result	The submission is accepted with only "test@c" filled in and every other field empty. No validation message appears for the empty fields or the bad email.
Impact	The form sends effectively empty submissions to the support inbox, with no usable content and no valid reply address. Worth noting: "test@c" passes the browser's built-in HTML5 email check (it allows dotless intranet-style domains), so relying on input type="email" alone is not enough. Required-field and email-format checks are needed on the server side too.
Evidence	Loom recording: captured; shared after contract start

BUG-008 | Signup accepts a malformed, undeliverable email (invalid_email@k) and creates the account

Module	Signup / Registration
Severity	Medium
Priority	P3 - Medium
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	None. The signup form is publicly accessible.
Steps to Reproduce	1. Go to https://automationexercise.com/login and find the "New User Signup!" section. 2. Enter any name and the email "invalid_email@k" (no top-level domain). 3. Click Signup, complete the account information form, and submit. 4. Check the outcome of account creation.
Expected Result	The email should be validated as a deliverable address (top-level domain required) on both client and server, and signup should be rejected with a clear message.
Actual Result	Signup goes through with no validation error and the account is created with "invalid_email@k" as its registered email.
Impact	The account's only contact and recovery channel does not work. Order confirmations and notifications can never arrive, and password recovery is impossible, so a user who forgets their password is locked out with no self-service option. These records also pollute the user database and inflate registration numbers. Same as BUG-007, the value passes the browser's permissive HTML5 check, so server-side format validation (TLD required) is the fix.

Related Defects	BUG-007, same root cause on the Contact Us form. Together they show email format validation beyond the browser default is missing across the application.
Evidence	Loom recording: captured; shared after contract start

BUG-009 | Footer shows outdated copyright year (2021)

Module	Footer / UI (site-wide)
Severity	Low
Priority	P4 - Low
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	None. The footer is visible on all public pages, no login required.
Steps to Reproduce	1. Go to https://automationexercise.com/. 2. Scroll to the bottom of the page. 3. Check the copyright text in the footer.
Expected Result	The footer should show the current year (e.g. "Copyright (c) 2026 All rights reserved") or use a dynamic year value.
Actual Result	The footer shows "Copyright (c) 2021 All rights reserved" while the site is live in 2026.
Impact	Cosmetic, but an outdated year makes the site look unmaintained and can weaken user trust. On a commercial product it may also have minor legal or branding implications. A dynamic year is a one-line fix.
Evidence	Screenshot: BUG-009_footer_copyright.png

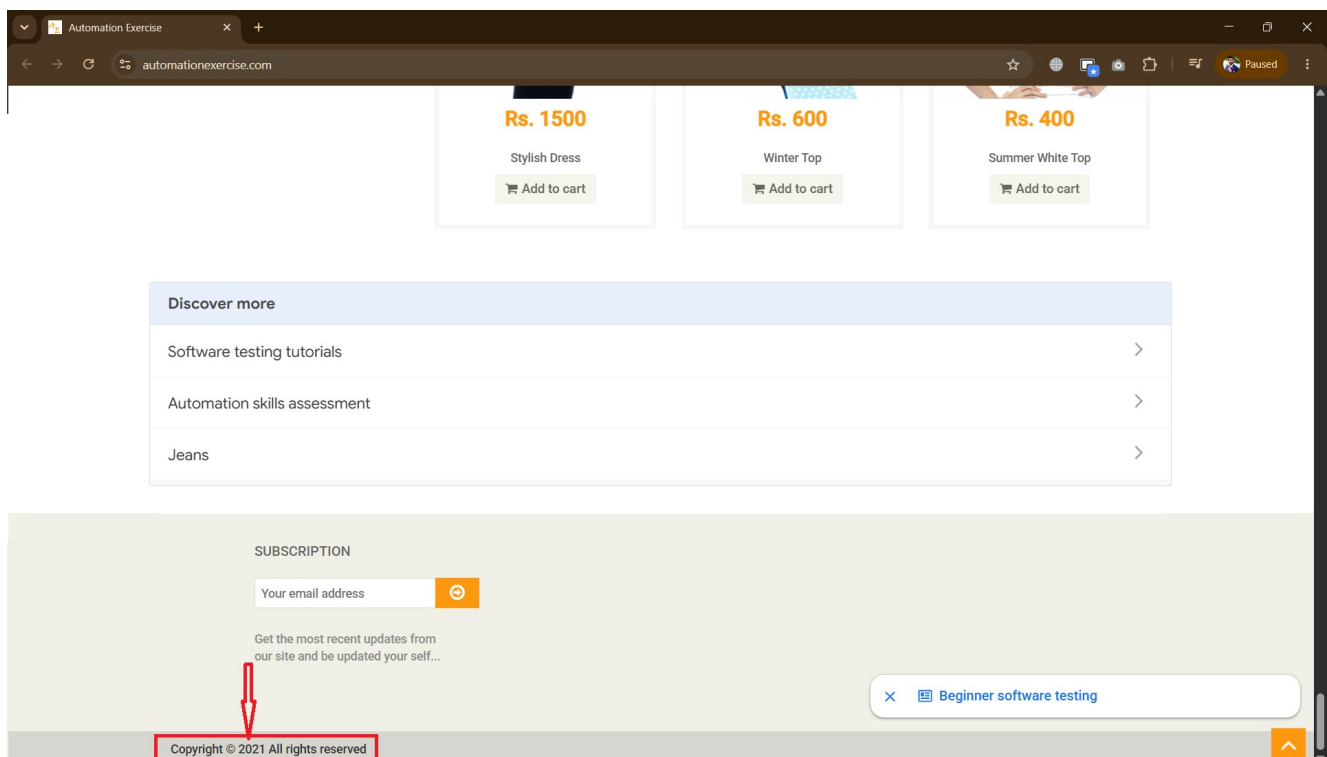

Figure 5: Site footer showing "Copyright (c) 2021 All rights reserved".

BUG-010 | Login page does not use Post/Redirect/Get, refresh re-submits form data and the validation error

Module	Login / Authentication
Severity	Low
Priority	P4 - Low
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	User is logged out. Any syntactically valid but unregistered email/password pair prepared as test data.
Steps to Reproduce	1. Go to https://automationexercise.com/login. 2. In the Login section, enter an incorrect email and password. 3. Click Login and note the validation error message. 4. Refresh the page (F5). 5. Check the state of the form fields and the validation message after the refresh. 6. To isolate the cause, open https://automationexercise.com/login in a new browser tab (fresh GET request) and check the form state there.
Expected Result	After a failed login the server should respond with a redirect (Post/Redirect/Get pattern) so the browser lands on the login page via GET. A refresh should then load a clean form without re-submitting credentials or re-showing a stale error.
Actual Result	The login POST response renders the page directly with no redirect. On refresh, including hard reload (Ctrl+Shift+R), the browser re-submits the original form data, restoring the typed credentials and showing the validation error again. The values come back even after clearing the fields manually before refreshing.
Impact	This is a usability and hygiene issue rather than a functional failure. The reappearing error can make users think a fresh attempt has already failed, and every refresh silently re-sends the credentials in a duplicate request. Post/Redirect/Get is the standard remedy and a low-effort fix.
Root Cause Notes	To separate server-side stale state from browser resubmission, the login URL was opened in a new tab (a guaranteed fresh GET). That rendered a completely clean form, so the server is not persisting validation state. The behavior comes from the browser re-submitting the POST because the page does not implement Post/Redirect/Get. Severity is Low for that reason.
Evidence	Loom recording: captured; shared after contract start

BUG-011 | Recommended Items carousel shows the price in place of the product name for one product

Module	Home Page / Recommended Items carousel
Severity	Low
Priority	P4 - Low
Environment	Chrome (latest stable) on Windows 11, 1920 x 1080
Preconditions	None. The Recommended Items carousel is on the home page, no login required.
Steps to Reproduce	1. Go to https://automationexercise.com/ and scroll to the "Recommended Items"

	section. 2. Use the carousel arrows to find the black dress priced Rs. 1000. 3. Check the product name field on the card. 4. Refresh the page (F5) and repeat steps 1-3 to check persistence. 5. Close the browser, reopen the site in a new session, and repeat steps 1-3.
Expected Result	Each carousel card should show the product name in the name field (matching the same product's card in the Features Items grid), with the price shown once in the price element.
Actual Result	For this one product the name field shows "Rs. 1000", so the card shows the price twice and no product name. The behavior persists across refreshes and new browser sessions. All other carousel items show correct names.
Impact	Users cannot identify the product from the card text and have to rely on the image alone, which defeats the point of a recommendations widget. Pricing and Add to cart still work, so the impact is limited to presentation and data quality.
Root Cause Notes	Three checks isolate the cause: all other carousel cards show correct names (so the template/binding is fine), the issue survives refreshes and new sessions (so it is not a rendering glitch), and the same product shows the correct name in the Features Items grid on the same page. The problem is in the data record behind this one carousel entry, whose name field contains the price string.
Evidence	Screenshot: BUG-011_carousel_price_as_name.png

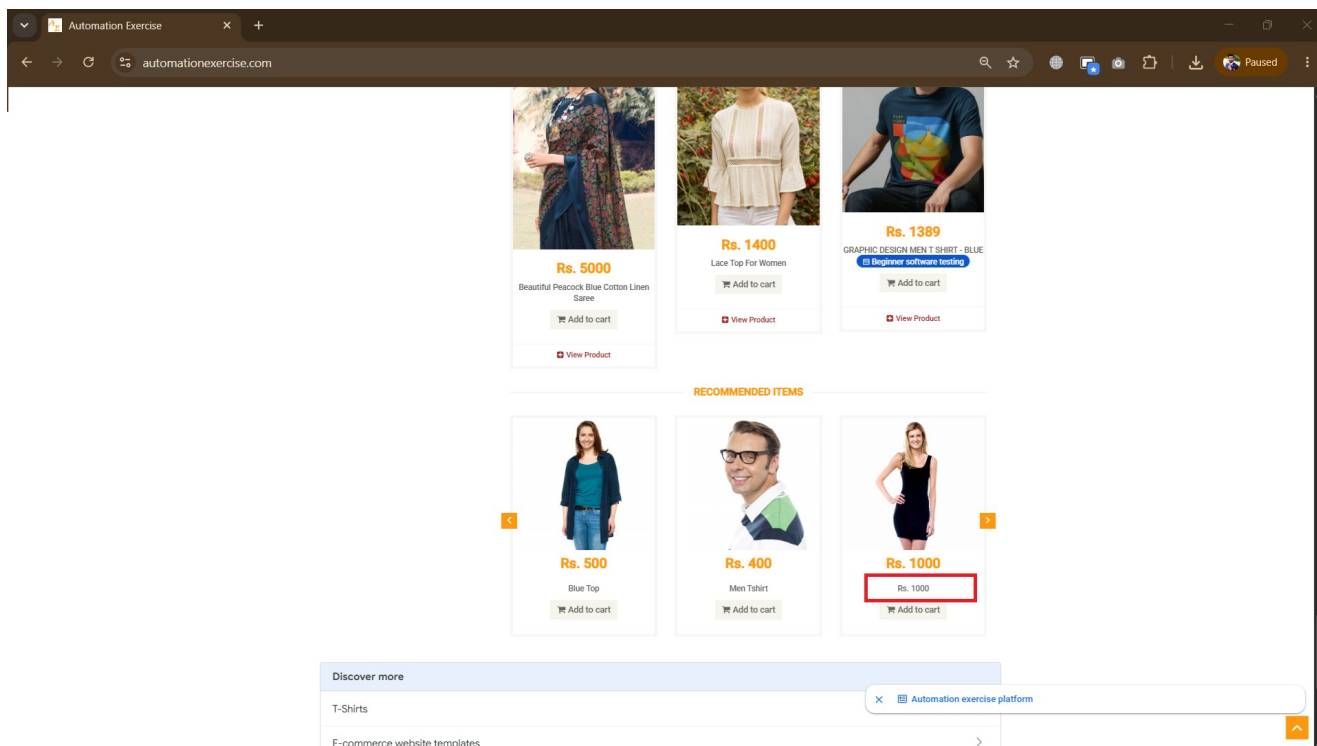

Figure 6: Recommended Items card for the black dress showing "Rs. 1000" in the product name field, price shown twice.

Appendix A: Evidence Index

Screenshots are annotated with red boxes/arrows on the defect area and named BUG-00X_short_name.png. Where a full flow is involved, a Loom screen recording is the primary evidence

Defect ID	Evidence	Content
BUG-001	BUG-001_negative_quantity_cart.png (embedded)	Cart with quantity -13 and total Rs. -13000
BUG-002	BUG-002_zero_quantity_checkout.png (embedded) + Loom recording	Cart with quantity 0, Rs. 0 total, and active checkout
BUG-003	Loom recording (primary evidence)	Second successful registration with case-variant email
BUG-004	Loom recording (primary evidence)	Account deleted directly from nav click, no confirmation
BUG-005	BUG-005_extreme_quantity_cart.png (embedded) + Loom recording	Cart with 13-digit quantity and active checkout
BUG-006	BUG-006_search_no_results_feedback.png (embedded)	Blank Searched Products section for a zero-match query
BUG-007	Loom recording (primary evidence)	Contact form submitted with empty fields and test@c
BUG-008	Loom recording (primary evidence)	Account created with invalid_email@k as registered email
BUG-009	BUG-009_footer_copyright.png (embedded)	Footer showing the 2021 copyright text
BUG-010	Loom recording (primary evidence)	Login form after refresh with persisted data and error
BUG-011	BUG-011_carousel_price_as_name.png (embedded)	Carousel card showing Rs. 1000 in the product name field

Defect ID	Loom Recording
BUG-001	[Redacted]
BUG-002	[Redacted]
BUG-003	[Redacted]
BUG-004	[Redacted]
BUG-005	[Redacted]
BUG-007	[Redacted]
BUG-008	[Redacted]
BUG-010	[Redacted]

Note: Loom screen-recording links and personal contact details are removed in this proposal copy per Upwork policy. Full evidence set (8 recordings) is shared after contract start.
